## 1. Transformations

As discussed in Sec. 3.1 of the main text, due to memory constraints, we use a subset of $M=54$ transformations. Let $T_{\text {rgb2gray }}$ be the transformation of an image from RGB to grayscale. $T_{\text {flip }}^{1}$ is a horizonal flip and $T_{f l i p}^{0}$ is the identity transformation. $T_{\text {translate }}^{b}$ is the horizontal translation along the x -axis by $15 \%$ of the image width, to the left ( $b=1$ ) or to the right $(b=-1) . b=0$ is the identity translation. $T_{\text {translate }_{y}}^{c}$ is the vertical translation along the y-axis by $15 \%$ of the image height, upwards $(c=1)$ or downwards $(c=-1) . c=0$ is the identity translation. $T_{\text {rotate }}^{d}$ stands for the rotation by $d$ degrees, where $d \in\{0,90,180,270\}$. $T_{1}, \ldots T_{32}: \quad T_{\text {flip }}^{a} \circ T_{\text {translate }_{x}}^{b} \circ T_{\text {translate }_{y}}^{c} \circ T_{\text {rotate }}^{d}$ where $a \in\{0,1\}, b \in\{0,1\}, c \in\{0,1\}$ and $d \in$ $\{0,90,180,270\}$.
$T_{33}, \ldots T_{38}: T_{\text {flip }}^{a} \circ T_{\text {translate }_{x}}^{b} \circ T_{\text {translate }_{y}}^{c}$, where $a \in$ $\{0,1\}, b \in\{-1,1,0\}$ and $c=-1$.
$T_{39}, \ldots T_{42}: T_{\text {flip }}^{a} \circ T_{\text {translate }_{x}}^{b} \circ T_{\text {translate }_{y}}^{c}$, where $a \in$ $\{0,1\}, b=-1$ and $c \in\{0,1\}$.
$T_{43}, \ldots T_{50}: T_{\text {rgb2gray }} \circ T_{\text {flip }}^{a} \circ T_{\text {rotate }}^{d}$, where $a \in\{0,1\}$ and $d \in\{0,90,180,270\}$.
$T_{51}, T_{52}: T_{\text {rgb2gray }} \circ T_{\text {translate }_{x}}^{b}$ where $b \in\{-1,1\}$.
$T_{53}, T_{54}: T_{r g b 2 g r a y} \circ T_{\text {translate }_{y}}^{c}$ where $c \in\{-1,1\}$.

## 2. Detailed Per-Class Results

In Sec. 4 of the main text, for the task of anomaly detection and defect detection, we report mean AUC values and mean standard deviation values, over all classes. Detailed per-class results are provided here.

In particular, full anomaly detection results for the datasets of Paris, CIFAR10, FashionMNIST and MNIST are given in Tab. 1 (one-shot), Tab. 2 (five-shot) and Tab. 3 (ten-shot). This supplements Fig. 2 of the main text. 50-shot and 80 -shot results for CIFAR10 are given in Tab. 4. Together with tables 1.3, this supplements Fig. 4 of the main text.

Tab. 5 gives the full defect detection results on MVTec for one-shot, five-shot and ten-shot settings, supplementing Fig. 5 of the main text.

Tab. 6, gives the ablation analysis performed on CIFAR10, for both the one-shot and five-shot settings, supplementing Tab. 1 and discussed in Sec. 4.3 of the main text.

Lastly, Tab. 7, shows the effect of using a different percentage of patches for detect detection, supplementing Fig. 7 and discussed in Sec. 4.3 of the main text.

Table 5. Average AUC (with standard deviation) for One-Shot, Five-Shot and Ten-Shot defect detection experiments on MVTec dataset. Ours1 refers to our method where the standard set of transformations are used, as for anomaly detection. For a fair comparison with DifferNet, we also consider Ours2, where only the four rotation are used, as in DifferNet. In the one-shot case, we report the results of using $5 \%$ of the patches, while in five-shot and ten-shot case we report the results of using $10 \%$ of the patches. The full results of using different percentage of patches are given in Tab. 7

Table 6. Ablation analysis for One-Shot and Five-Shot anomaly detection, as described in the main text, Sec. 4.3, Tab. 1. Our method relies on three components: (1) a generative model, (2) its hierarchical multi-scale nature, and (3) a transformation-discriminating component. We assess the contribution of these components separately. The columns of the table represent different variants: (a) no generative component, (b) transformations not applied discriminatively, (c) as for (b), but where augmentations are applied before passing real and generated images to the discriminator. (d) a single scale of the hierarchy where small patches are considered (image size set to $100 \times 100$ ), (e) a single scale of the hierarchy where large patches are considered (image size set to $20 \times 20$ ), (f) no component is used and the anomaly score is the MSE between the test image and the training image (average for each training image for five-shot). Finally, the last variant (g) trains a GEOM model on 6,000 images sampled from our generative model that is trained on a one/five sample.
